

SPORTS PITCH CLEANING & MAINTENANCE

Artificial Grass, Synthetic Turf, 3G & Astro Turf Sports Pitches & MUGA'S

Decompacts Infill – Cleans Infill – Redistributes Infill & Adjusts Levels – Removes Moss & Algae – Lifts Carpet Pile

Astro turf pitches and MUGA's require regular cleaning and maintenance to ensure they maintain their intended play characteristics and ensure that they are safe for users. Regular maintenance helps keep the carpet pile upright and separated the infill clean and free draining and the infill at the correct levels.

Astro turf pitch contaminated by moss & algae

Astro turf pitch cleaning decompacting infill and removing contamination

Depending on any maintenance regimes, the location of the astro and the degree of use, an astro turf pitch will require regular maintenance to fulfil its useful existence. Activities such as drag brushing, moss and algal chemical treatments, and regular cleaning of the surface will help keep the surface in good, serviceable condition. The surface should be inspected regularly and any repairs that are required should be carried out immediately.

Infill compaction & contamination leads to flooding and poor drainage

3G rubber filled astro surface

Poor drainage is a sign of a contaminated and compacted surface which not only prevents or reduces play but can lead to a condition known as 'algal squidge' which produces a slippery algal bloom over the astro surface which is not only unsightly but very slippery.
